

GI Functions	Disorder	Key Assessment Data	Diagnosis & Treatment	Nursing Priorities	Complications
Digestion	<b>Peptic Ulcers</b>	<p>Gastric:</p> <ul style="list-style-type: none"> <li>-Epigastric discomfort 1 to 2 hours after meal; burning or gaseous pain; food may worsen</li> <li>-Perforation is first symptom in some patients</li> </ul> <p>Duodenal:</p> <ul style="list-style-type: none"> <li>-Occur, disappear, recur</li> <li>-Burning or cramplike pain in midepigastic or back; 2 to 5 hours after meal</li> </ul> <p>Both:</p> <ul style="list-style-type: none"> <li>Bloating, nausea, vomiting, early feeling of fullness</li> </ul>	<p>Diagnosis</p> <ul style="list-style-type: none"> <li>-Endoscopy</li> <li>-R/O H Pylori infection</li> <li>-CBC, liver enzyme studies, serum amylase, and stool examination -- often looking for signs of bleeding</li> </ul> <p>Treatment</p> <ul style="list-style-type: none"> <li>-Reduce acid secretion - PPIs, abx for H Pylori</li> <li>-Sucralfate: given 1 hr before or after antacid to protect esophagus, stomach, and duodenum</li> <li>-Surgical management uncommon</li> </ul>	<ul style="list-style-type: none"> <li>-Teach about diet/lifestyle changes: avoid foods that cause distress or irritation; avoid caffeine and alcohol</li> <li>-Stop NSAIDs</li> <li>-Treat pain - what would we use? Think about what's causing the pain (NPO, IVF, NG to intermittent suction - decreases acid)</li> <li>-What would we worry about if someone is on NG suction? -Electrolyte imbalance</li> <li>-Emotional rest - decrease stress</li> <li>-Monitor for s/s of bleeding, increased pain, s/s perforation (below), gastric outlet obstruction (N/V, absent bowel sounds)</li> </ul>	Perforation: -GI contents spill into peritoneal cavity

	<b>Gallbladder disease</b>	<p><b>Cholelithiasis:</b></p> <ul style="list-style-type: none"> <li>-Asymptomatic if the stones stay in the gallbladder</li> <li>-Pain more severe when stones moving or obstructing</li> <li>-RUQ pain that occurs 3 to 6 hours after high-fat meal or when patient lies down, lasts for minutes to hours</li> <li>-Pain occurs from temporary obstruction</li> </ul> <p><b>Cholecystitis:</b></p> <ul style="list-style-type: none"> <li>-Pain is steady (&gt; 6hrs), excruciating</li> <li>-Pain can be in RUQ and referred to R shoulder</li> <li>-Accompanied by signs of inflammation (fever, leukocytosis, N/V, tachycardia, diaphoresis)</li> </ul>	<p><b>Diagnosis</b></p> <ul style="list-style-type: none"> <li>-Ultrasound</li> <li>-ERCP for direct visualization of the gallbladder</li> <li>-Percutaneous transhepatic cholangiography - inject contrast to visualize obstruction</li> <li>-Labs: CBC, serum enzymes (think liver enzymes), urine studies - look @ bilirubin</li> </ul> <p><b>Treatment</b></p> <ul style="list-style-type: none"> <li>-Drugs are possible for conservative management</li> <li>- ursodiol and chenodiol dissolve the stones</li> <li>-Laparoscopic cholecystectomy for symptomatic gallstones</li> <li>-Splinting of the bile duct can be done during ERCP</li> <li>-Anticholinergics can decrease GI secretions and counteract smooth muscle spasms</li> </ul>	<ul style="list-style-type: none"> <li>-Promote comfort, prevent recurrence</li> <li>-Pain control - opioids</li> <li>-NPO status &amp; IVF</li> <li>-Low-fat diet</li> <li>-Antiemetics</li> <li>-Antibiotic administration</li> <li>-Gastric decompression with NG tube</li> <li>-Lifestyle: gradual weight loss, smaller more frequent meals to promote gallbladder emptying</li> <li>-Amount of fat in diet will be determined by how patient tolerates fat</li> </ul>	<ul style="list-style-type: none"> <li>-Biliary obstruction: dark amber urine d/t excretion of bilirubin in the urine (can't get to small intestine to be broken down to urobilirubin); jaundice, clay-colored stools</li> <li>-Decreased absorption of vitamin K &amp; decreased production of prothrombin in the liver - bleeding</li> <li>-Pancreatitis</li> <li>-Abscess formation</li> </ul>
--	----------------------------	--	---	--	---

Absorption	<b>Gastric surgery</b>	<p>Types:</p> <ul style="list-style-type: none"> <li>-Partial gastrectomy</li> <li>-Gastroduodenostomy</li> <li>-Gastrojejunostomy</li> <li>-Vagotomy</li> </ul>	<b>X</b>	<ul style="list-style-type: none"> <li>-Monitor Is &amp; Os, electrolyte balance</li> <li>-Daily weights</li> <li>-Prevent respiratory complications postop - teaching about incision splinting, cough/deep breathing</li> <li>-Pain management</li> <li>-N/V management</li> <li>-Prevent infection</li> <li>-NG tube for decompression immediately post-op -- reduces pressure to suture line, decreases inflammation; bloody drainage is expected for 2-3 but no more than 75 mL/hr; output darkens to yellow-green in 36-48 hours</li> <li>-Consult dietitian</li> <li>-Multivitamin administration for wound healing and anemia prevention, iron</li> <li>-Nutrition: soft bland diet initially, small &amp; frequent meals, avoid simple sugars, lactose &amp; fried foods, limit sugar to avoid hypoglycemia</li> <li>-Increase protein &amp; fat intake</li> </ul>	<ul style="list-style-type: none"> <li>-Dumping syndrome</li> <li>-Postprandial hypoglycemia</li> <li>-Bile reflux gastritis</li> <li>-Pulmonary complications, like after any abdominal surgery</li> <li>-Anastomosis leak -- tachycardia, dyspnea, fever, abdominal pain (can cause sepsis)</li> <li>-Bleeding</li> </ul>
Elimination	<b>Hernias</b>	<ul style="list-style-type: none"> <li>-Painful - increases with activities that increase intraabdominal pressure</li> <li>-May be externally visible</li> </ul>	<p>Diagnosis</p> <ul style="list-style-type: none"> <li>-History</li> <li>-Physical exam</li> <li>-Imaging: US, CT, MRI</li> </ul> <p>Treatment</p> <ul style="list-style-type: none"> <li>-Reduce intraabdominal pressure - weight loss, repositioning</li> </ul>	<ul style="list-style-type: none"> <li>-Is &amp; Os</li> <li>-Encourage coughing &amp; deep breathing - splinting surgical site</li> <li>-Should cough/sneeze with open mouth to reduce intraabdominal pressure</li> <li>-Avoid heavy lifting (10+ lbs) for 6-8 weeks</li> </ul>	<ul style="list-style-type: none"> <li>-Strangulated bowel: blood supply is compromised; very painful, vomiting, cramping, distention</li> <li>-Requires emergency surgery &amp; temporary colostomy</li> <li>-Bowel obstruction, gangrene, and necrosis</li> </ul>

			-Surgical treatments: close the defect and prevent re-herniation -Can use wire, fascia, or mesh to reinforce weakened area of tissue		
	<b>Diverticulosis</b>	-Usually asymptomatic -If symptomatic: abdominal pain, bloating, flatulence, changes in bowel habits -May see bleeding	Diagnosis -History -Found during routine colonoscopy  Treatment: -Diet & lifestyle modifications	-Encourage a high-fiber diet - encourage fruits & vegetables -Supplement fiber -Avoid red meats and fatty foods -Goal fluid intake of 2L/day -Weight loss if overweight - helps avoid exacerbations due to increased intraabdominal pressure -Stop smoking	Diverticulitis
	<b>Ostomy</b>	-Stoma assessment: pink-red, mild swelling, small amount of blood d/t vascularity of GI tract  Ileostomy: -Output is liquid or thin paste - didn't enter the colon; elimination is involuntary and drains frequently  Colostomy: -Output resembles a normal formed stool; possible for patients to regulate emptying time	X	-Pre-op: help with stoma site selection (flat surface, allow for patient visibility and allow them to hide under clothing) -Wound care nurse consultation for education - when? PRE-OP -Post-op care: assess incision for s/s infection; REEDA -Frequent dressing changes in the first few hours due to profuse drainage -Record volume, color, and consistency of output -Ileostomies: have minimal output first 24-48 hours d/t decreased gut motility after surgery -Teach about fluid intake - 2-3L/day for ileostomies	-Stoma: dusky/cyanotic = inadequate blood supply; brown/black = necrosis -Severe edema = obstruction -Moderate-severe bleeding = lower GI bleed or coag deficiency -Bowel obstruction
Inflammation/	IBS	Crohn's disease -Mouth to anus	Diagnosis -History	-Consult dietitian - correct/prevent	Crohn's: --Strictures - obstruction -Abscesses

	<p><b>Crohn's disease + Ulcerative Colitis</b></p> <ul style="list-style-type: none"> <li>-Affects entire thickness of bowel</li> <li>-Skip lesions</li> <li>-Cobblestoning of mucosa</li> <li>-Pain: cramping</li> <li>-Diarrhea</li> <li>-Malabsorption</li> <li>-+/- rectal bleeding</li> <li>-Severe weight loss</li> <li>-↑ risk of small intestine &amp; CRC</li>   <li><b>Ulcerative colitis</b></li> <li>-Only affects colon mucosa</li> <li>-Starts in rectum and moves upwards – continuous inflammation</li> <li>-Pain: severe, constant</li> <li>-Diarrhea, +bloody</li> <li>-Urge to defecate even when bowel is empty</li> </ul>	<ul style="list-style-type: none"> <li>-Labs: CBC, electrolytes, albumin, ESR, CRP, WBCs</li> <li>-Stool studies: look for blood, pus, mucus, infection</li> <li>-Need to rule out other diseases/acute processes</li> <li>-Imaging: barium enema, small bowel series, ultrasound, CT, MRI, colonoscopy, endoscopy for Crohn's</li> </ul> <p><b>Treatment</b></p> <ul style="list-style-type: none"> <li>-Rest the bowel</li> <li>-Control inflammation</li> <li>-Correct malnutrition</li> <li>-Relieve symptoms</li> <li>-Improve quality of life</li> </ul> <p><b>Drug therapy</b></p> <p>UC: corticosteroids + aminosalicylates or biologics</p> <p>Crohn's: biologics + corticosteroids</p> <p>May be some crossover in meds - some are used for both</p> <ul style="list-style-type: none"> <li>-Aminosalicylates: suppress inflammatory cytokine production; oral or rectal admin</li> <li>-Antimicrobials</li> <li>-Corticosteroids: prevent/decrease inflammation of intestinal mucosa; goal is to give for the shortest period of time that's effective; given PO, IV, or as a suppository</li> <li>-Immunomodulators: maintain remission after corticosteroids; risk for</li> </ul>	<ul style="list-style-type: none"> <li>malnutrition and correct/prevent F+E losses</li> <li>-Supplements - folic acid, calcium, potassium</li> <li>-Exacerbations: liquid diet high in calories and nutrients, lactose-free, easily absorbed</li> <li>-High fat foods trigger diarrhea</li> <li>-Food diary</li> <li>-Pain control -</li> <li>-Accurate Is &amp; Os</li> <li>-Daily weights</li> <li>-Post-op care</li> <li>-Education: disease management, stress reduction, perianal care, diet management</li> </ul>	<ul style="list-style-type: none"> <li>-Fistulas</li> <li>Ulcerative colitis</li> <li>-Toxic megacolon – risk of perforation</li> <li>-Iron deficiency anemia</li>   <li>Both</li> <li>-Colorectal cancer (greater in UC)</li> <li>-C diff infections</li> <li>-Perforation (inflammation, megacolon)</li> </ul>
--	--	--	---	--

		<p>infection &amp; bleeding d/t bone marrow suppression          -Biologics: reduce inflammation by blocking specific proteins; generally given IV or subQ to induce &amp; maintain remission (caution with opportunistic infections)</p> <p>Surgery:          -Crohn's: done for complications like obstructions or resection of diseased portions of the intestine OR for widening of narrowed portions          -UC: done after complications or poor response to treatment; colectomy with anal anastomosis OR ostomy formation is curative</p>		
Diverticulitis	<ul style="list-style-type: none"> <li>-Acute pain in LLQ</li> <li>-Distention</li> <li>-Hypoactive/absent bowel sounds</li> <li>-N/V</li> <li>-Systemic infection s/s</li> </ul>	<p>Diagnosis</p> <ul style="list-style-type: none"> <li>-History</li> <li>-Testing stool for occult blood</li> <li>-Labs: CBC, urinalysis</li> <li>-Imaging: CT w/contrast is preferred; KUB, MRI, ultrasound</li> </ul> <p>Treatment</p> <p>Surgery</p> <ul style="list-style-type: none"> <li>-Affected colon is removed &amp; anastomosed, may need temporary colostomy that can later be taken down</li> </ul>	<ul style="list-style-type: none"> <li>-NPO - clears with improving symptoms</li> <li>-IVF + electrolyte replacement as ordered, especially while NPO</li> <li>-Monitor WBCs</li> <li>-Medications: pain management, antibiotics</li> <li>-Bedrest</li> <li>-Strict Is &amp; Os</li> <li>-Frequent oral cares</li> <li>-NG suction</li> </ul>	<ul style="list-style-type: none"> <li>-Abscesses</li> <li>-Bleeding</li> <li>-Peritonitis</li> </ul>
Appendicitis	<ul style="list-style-type: none"> <li>-Dull periumbilical pain that is persistent and continuous</li> <li>-Eventually moves to RLQ - McBurney's point</li> <li>-Anorexia, N/V, low-grade fever</li> </ul>	<p>Diagnosis</p> <ul style="list-style-type: none"> <li>-History</li> <li>-WBC - high</li> <li>-UA - rule out other conditions</li> </ul>	<ul style="list-style-type: none"> <li>-Prevent FVD, relieve pain, prevent complications</li> <li>-Maintain NPO status</li> <li>-Frequent VS and focused assessment</li> </ul>	<ul style="list-style-type: none"> <li>-Rupture - IV abx</li> <li>-Peritonitis</li> </ul>

		<ul style="list-style-type: none"><li>-Rigidity, rebound tenderness, guarding</li><li>-"Kick the bed"</li><li>-Flexing of the right leg helps with pain</li><li>-Be worried if pain suddenly gets better - rupture</li></ul>	<ul style="list-style-type: none"><li>-CT is preference, though ultrasound is common Treatment</li><li>-Immediate appendectomy</li><li>-Antibiotics &amp; fluid resuscitation pre-op</li></ul>	<ul style="list-style-type: none"><li>-Medications: IVF (what kind? - isotonic), analgesics, antiemetics</li><li>-Allow position of comfort</li><li>-Post-op: promote ambulation, advance diet as tolerated</li></ul>
